Chocolate Feast

Problem Statement

Little Bob loves chocolates, and goes to a store with \$N in his pocket. The price of each chocolate is \$C. The store offers a discount: for every M wrappers he gives to the store, he gets one chocolate for free. How many chocolates does Bob get to eat?

Input Format:

The first line contains the number of test cases T(<=1000). T lines follow, each of which contains three integers N, C and M

Output Format:

Print the total number of chocolates Bob eats.

Constraints:

 $2 \le N \le 10^5$ $1 \le C \le N$ $2 \le M \le N$

Sample input

3 10 2 5 12 4 4 6 2 2

Sample Output

6 3 5

Explanation

In the first case, he can buy 5 chocolates with \$10 and exchange the 5 wrappers to get one more chocolate. Thus, the total number of chocolates is 6.

In the second case, he can buy 3 chocolates for \$12. However, it takes 4 wrappers to get one more chocolate. He can't avail the offer and hence the total number of chocolates remains 3.

In the third case, he can buy 3 chocolates for \$6. Now he can exchange 2 of the 3 wrappers and get 1 additional piece of chocolate. Now he can use his 1 unused wrapper and the 1 wrapper of the new piece of chocolate to get one more piece of chocolate. So the total is 5.
